

SUMMARY

Full Stack Software Engineer with **5+ years of experience** building scalable, cloud-based applications, with hands-on expertise in **Python, React, REST APIs, SQL, and Java**. Currently contributing to full-stack application development at **T-Mobile**, with strengths across modern frontend development, backend services, and **CI/CD** practices. Progressed from Full Stack Developer to Software Engineer roles across enterprise environments, delivering maintainable solutions through **cross-functional collaboration, code reviews, and software development best practices**.

EDUCATION

Master of Science in Computer Science | University of Central Missouri, Lee's Summit, Missouri

Bachelor of Technology in Electronics and Communication Engineering | Seshadri Rao Gudlavalleru Engineering College, India

SKILLS

- **Programming Languages:** Python, Java, JavaScript, TypeScript, SQL, Bash
- **Frameworks & Full-Stack Technologies:** React.js, Flask, FastAPI, HTML5, CSS3, SCSS, REST APIs, Node.js, Spring Boot, GraphQL, Swagger/OpenAPI
- **Cloud, DevOps & Data:** Google Cloud Platform (GCP), Cloud Run, Cloud Storage, API Gateway, GitHub, GitHub Actions, Terraform, Tekton, CI/CD Pipelines, Infrastructure as Code (IaC), SQL/Relational Database Design, PostgreSQL, Docker, Kubernetes, Git, Role-Based Access Control (RBAC), HTTP/S, DNS, Networking, Load Balancing
- **AI-Assisted Development & Tools:** GitHub Copilot, Claude Code, OpenAI Codex, ChatGPT, Prompt Engineering, AI-Assisted Development

EXPERIENCE

T-Mobile | Full Stack Developer

Sep 2025 – Present | USA

- Engineered **Python/Flask REST APIs** and automation services across T-Mobile's WAF and edge-security platform, integrating internal systems while applying HTTP/S, networking, input validation, and production safeguards to automate operational workflows.
- Developed an external attack-surface discovery pipeline using Python and DNS/network checks, identifying **7,067 subdomains and 1,220 security alerts across 16 scans** while detecting WAF bypass, IPv6, HTTP, geo-routing, and subdomain-takeover risks.
- Automated ServiceNow ticket processing through **API-based workflows**, creating a 10-minute scheduled triage service that processed available tickets in 11–19 seconds per sweep and applied idempotency controls, assignment logic, and persistent SQL/SQLite state to prevent duplicate processing.
- Implemented higher-risk write-path automation for vendor IP updates using **Terraform/Infrastructure as Code (IaC)**, applying single-writer locking, batching, retry/backoff, and controlled activation safeguards to improve deployment reliability when the underlying activation API was unreliable.
- Streamlined development across the tool portfolio by creating **11 reusable knowledge packs** covering Akamai, Splunk, ServiceNow, Microsoft Graph, authentication, API, and process-management patterns, helping teammates reuse proven integration approaches.
- Collaborated with security analysts and engineering stakeholders to translate operational requirements into **React/TypeScript dashboards, Python automation, API integrations, scheduled services, and production monitoring**, contributing to troubleshooting and iterative application improvements.

Hartford Financial Services Group | Full Stack Developer

July 2024 – July 2025 | USA

- Refactored customer-facing **React** interfaces into reusable, component-based modules and improved application state-management workflows by approximately **25%**, strengthening maintainability and delivering more consistent frontend behavior.
- Migrated legacy application workloads toward cloud infrastructure, containerizing services with **Docker** and improving deployment workflows that reduced associated cloud costs by approximately **20%** while maintaining application reliability.
- Created backend services using **Python and RESTful APIs**, integrating them with React interfaces to support end-to-end full-stack application workflows while applying clean-code, testing, and maintainability best practices.
- Optimized **RDBMS schemas and SQL-based data solutions**, writing efficient SQL queries to support application data flows and reliable integration between Python backend services and frontend features.
- Supported automated **CI/CD pipelines** and environment-specific Docker deployments, troubleshooting application and release issues while using CloudWatch, Grafana, Splunk, and ELK to improve observability across environments.
- Partnered with developers and cross-functional teams through Agile/Scrum, peer code reviews, feature discussions, testing, and production support across **React frontend, Python backend, SQL databases, cloud deployment, and CI/CD workflows**.

Tata Consultancy Services | Full Stack Developer

Aug 2019 – Feb 2023 | India

- Contributed to full-stack application features using **Python and React**, creating responsive user interfaces and backend services while following established coding, testing, and peer-review practices.
- Integrated **REST APIs** for customer-facing workflows, connecting frontend components with backend services and **SQL** data sources to streamline application functionality and data access.

- Deployed **Python** full-stack applications on **Google Cloud Platform (GCP)** using **Cloud Run, Cloud Storage, and API Gateway**, gaining experience with cloud-native application configuration, troubleshooting, production support, and established CI/CD workflows.
- Crafted responsive **React** interfaces using **HTML5, CSS3, and SCSS**, integrating frontend components with REST APIs while following established coding, testing, and peer-review practices.
- Expanded full-stack expertise across **Python, React, REST APIs, SQL, and GCP**, progressing from foundational development assignments to contributing across frontend, backend, database, and cloud application layers.
